

### Part # 11046210 - 1958 Chevrolet "B" Body Rear CoilOver System

#### Kit Components:

11046210      Rear CoilOver Kit Includes:  
                     Rear Lower StrongArms  
                     Rear CoilOvers

11046699      Rear Upper StrongArm

### Included Components .....In the box

Item #	Part #	Description	QTY
1	90000505	Rear Upper Control Arm	1
2	70010759	Bushing Half	4
3	90000549	Inner Bushing Sleeve	2
4	99501005	1/2"-13 x 3 1/2" Bolt	3
5	99502009	1/2"-13 Nylok Nut	3
6	99503014	1/2" SAE Flat Washer	3

### Getting Started.....

**1.** Raise the vehicle up to a comfortable work height. You will need the support the car by the frame to be able to freely raise and lower the rear axle. Use a jack under the differential to support it. It is best to put the jack toward the pinion, you may need to raise or lower the pinion to attach the control arm to the differential.

**Note:** Install the lower control arms before installing the upper control arm.

**2.** Remove the OEM upper control arm from the car.

**3.** Inspect the bushings in the differential, replace if necessary.

### Upper StrongArm Installation

- 4.** Bolt the new upper control arm in the OEM location using the hardware supplied in the kit. The control arm is attached to the car using (3) 1/2"-13 x 3 1/2" bolts, 1/2" flat washers, and 1/2"-13 nylok nuts. Tighten the hardware enough to eliminate any gaps.

15	4	99502009	1/2"-13 Nylok Nut		2	99313002	5/16" SAE Flat Washer
					2	99313003	5/16" Split Lock Washer

#### R-JOINT SPACER INSTALLATION

Install the Spacers by inserting the SMALL side of the SPACER into the Center Pivot Ball. Push them in until they bottom out and stop.

#### UPPER R-JOINTS

New R-Joints will be quite stiff (75-90 in/lbs breakaway torque) until they "break in" after a few miles of use. After the break in period they will move much more freely. Because the composite bearing race contains self lubricating ingredients, no additional lubrication is needed or desired. Any additional lubrication will only serve to attract more dirt and debris to the R-Joint and actually shorten its life.

### Getting Started.....

Congratulations on your purchase of the Ridetech B-Body CoilOver StrongArms. These StrongArms have been designed to give your B-Body excellent handling along with a lifetime of enjoyment. Some of the key features of the StrongArm System: The StrongArms are designed to utilize a CoilOver Shock setup, R-Joints are used to eliminate bushing deflection along with providing free suspension movement through the entire travel. The R-Joints are made from a material that is self lubricating so no lubrication is needed.

**Note:** These control arms are designed for use with the Ridetech CoilOvers and the MuscleBar swaybar. **The factory shocks and springs will not fit these StrongArms. If you have a swaybar that attaches to the lower control arms, it will NOT work with these StrongArms.**

1. Raise the vehicle up to a comfortable work height. You will need the support the car by the frame to be able to freely raise and lower the rear axle. Use a jack under the differential to support it.
2. Remove the rear shocks, coil springs, and lower control arms. The lower shock mounts are lightly pressed into the lower control arm mount and will not turn. You will need to drive these out with a hammer. Put something over the end of the threads to keep from damaging them.

### Upper Mount Installation

2. This kit contains a Upper Shock Mount setup that will require drilling to install it. **Image 2** is of the upper mount installed, we will cover the installation in the next steps. The rear of the plate will need to be aligned with the body mount that is to the rear of the coil spring mount. See the ARROW in **Image 2**.

3. The upper mount bolts into the car and will require the holes to be drilled. Start by holding the plate up in the car aligning the back edge with the body mount. Mark the holes on the frame.

4. The frames of these cars varied through the years, some have a center hole, some are solid. The frame we are doing this install on has a center hole. If the frame is solid, drill the marked holes with a 1/2" drill bit. Frames with the center hole will require a die-grinder or something similar to notch the edges of the center hole. We used a die-grinder with a burr bit to notch the holes. Repeat **Steps 2-4** on the opposite side.

### Upper Mount Installation

**6.** The Upper Mount is attached to the frame using (2) 1/2"-13 x 1 1/2" Bolts. Insert the bolts through the shock mount and into the upper plate.

**7.** Position the Shock Mount/Plate up into the frame, holding the shock mount and hardware in place.

**8.** Install the Upper Backer plate by installing it on the 1/2" bolts that are sticking through the top side of the frame. Install a 1/2"-13 nylok nut on each of the bolts sticking through the frame and backer plate. Torque the hardware to 75 ftlbs. Repeat for the second side of the car.

### Lower StrongArm Installation

9.

9. The Lower Control Arm has the bottom CoilOver mount built in, it will need to be installed with the CoilOver mount up and to the rear of the car. Install a 5/8" ID R-joint Spacer into the front R-joint. The Small Diameter goes into the R-joint. Slide the R-joint into the OEM lower control arm mount. Align the holes in the frame with the thru-hole of the R-Joint.

**NOTE:** This kit contains (4) 5/8"-18 x 4" bolts, 2 of these bolts have a FLAT machined into them. The 2 bolts with the flat will be used in the REAR of the lower control arms.

10.

10. Install a 5/8" Flat Washer on a 5/8"-18 x 4" bolt. Insert the bolt/washer into the frame/R-Joint of the lower bar. Install a 5/8" flat washer and 5/8"-15 nylok nut on the threads of the bolt sticking through the frame. Tighten the hardware to eliminate any gaps.

11.

11. Install the R-joint spacers into the rear R-Joints. Slide the rear of the lower control arm into the axle mount. Line up the mounting holes in the axle mount with the center hole of the R-joint. THE REAR R-JOINT REQUIRES THE 5/8"-18 x 4" BOLT WITH THE FLAT MACHINED INTO THE THREADS. Install a 5/8" flat washer on the 4" bolt with the flat. Insert the bolt/washer through the mounting hole. Align the Flat with the flat in the outer flange of the lower axle mount. Install a 5/8" flat washer and 5/8"-15 nylok nut on the threads of the bolt sticking through the frame. Tighten the hardware to eliminate any gaps.

### Shock Installation

**12.** Insert the shock bearing t-bushings into the bearing of the shock body. Insert the shock into the upper mount, lining up the holes of the mount and shock. Install a 1/2" flat washer on a 1/2"-13 x 2 1/2" bolt. Insert the bolt/washer into the upper mount/shock. Install a 1/2" flat washer and 1/2"-13 nylok nut and Torque to 50 ftlbs.

**13.** Insert the shock bearing t-bushings into the bearing of the shock eyelet. Insert the shock into the lower control arm, lining up the holes of the mount and shock. Install a 1/2" flat washer on a 1/2"-13 x 2 1/2" bolt. Insert the bolt/washer into the upper mount/shock. Install a 1/2" flat washer and 1/2"-13 nylok nut and Torque to 50 ftlbs.

**14.** Bolt the tab of the emergency brake cable to the provision in the lower control arm. This provision is built into the lower shock mount. Use the 5/16"-18 x 3/4" bolt, 5/16" split lock washer, and 5/16" flat washer to attach the cable. Torque the hardware to 12 ftlbs.

Compressed: 9.43"

Ride Height: 11.50"

Extended: 13.03"

### Major Components .....In the box

Item #	Part #	Description	QTY
1	982-10-803	3.6" Stroke HQ Series Shock	2
2	815-05-022-KIT	1.7" Shock Eyelet	2
4	59080575	Coilspring 8" 575lb	2
5	70010828	Delrin Spring Washer	4
6	803-00-199(kit)	Lower Spring Adjuster Nut (803-00-199 kit)	2
7	803-00-199(kit)	Adjuster Nut Locking Screw (803-00-199 kit)	2
8	803-00-199(kit)	Retaining Ring (803-00-199 kit)	2
9	90002043	Shock Bearing Spacers	8
	90001994	5/8" ID Bearing (installed in shock and eyelet)	4
	90001995	Bearing Snap Ring (installed in shock and eyelet)	8

## CoilOver Assembly...

**1**

First, using the supplied lower adjuster nut (803-00-199) thread the nut onto the shock from the bottom side as seen in figure 1. Remove the plastic pellet that is in the split of the adjuster nut.

**4**

Once the knob is removed slide a Delrin washer over the eyelet. Next, slide the upper spring mount (803-00-199) over eyelet as seen in figure 4.

**2**

Next, install a delrin washer then coil spring over the top of the shock as seen in figure 2.

**5**

Install upper spring mount retainer clip (803-00-199) into the groove on the upper eyelet as seen in figure 5. Then, reinstall adjuster to complete assembly.

**3**

Before the upper spring mount can be installed screw the adjuster knob on the upper eye mount to the firmest setting (clockwise) as seen in figure 3. Then remove the Knob by holding it while removing the center screw.

**Install the locking screw in the adjuster nut before setting spring preload, but DO NOT tighten until the spring preload has been set.**

**NOTE:** Remember to adjust the shock valving before driving, the shock is currently set to full stiff.

## Shock Adjustment 101- Single Adjustable

### Rebound Adjustment:

How to adjust your new shocks.

The rebound adjustment knob is located on the top of the shock absorber protruding from the eyelet. You must first begin at the ZERO setting, then set the shock to a medium setting of 12.

-Begin with the shocks adjusted to the ZERO rebound position (full stiff). Do this by rotating the rebound adjuster knob clockwise until it stops.

-Now turn the rebound adjuster knob counter clock wise 12 clicks. This sets the shock at 12. (settings 21-24 are typically too soft for street use).

Take the vehicle for a test drive.

-if you are satisfied with the ride quality, do not do anything, you are set!

-if the ride quality is too soft increase the damping effect by rotating the rebound knob clock wise 3 clicks.

**Take the vehicle for another test drive.**

-if the vehicle is too soft increase the damping effect by rotating the rebound knob clock wise 3 additional clicks.

-If the vehicle is too stiff rotate the rebound adjustment knob counter clock wise 2 clicks and you are set!

Take the vehicle for another test drive and repeat the above steps until the ride quality is satisfactory.

### Note:

**One end of the vehicle will likely reach the desired setting before the other end. If this happens stop adjusting the satisfied end and keep adjusting the unsatisfied end until the overall ride quality is satisfactory.**

## Final Tightening and Adjusting

### Ride Height

We have designed most cars to have a ride height of about 2" lower than factory. To achieve the best ride quality & handling, the shock absorber needs to be at 40-60% overall travel when the car is at ride height. This will ensure that the shock will not bottom out or top out over even the largest bumps. Measuring the shock can be difficult, especially on some front suspensions. Measuring overall wheel travel is just as effective and can be much easier. Most cars will have 4-6" of overall wheel travel. One easy way to determine where you are at in wheel travel is to take a measurement from the fender lip (center of the wheel) to the ground. Then lift the car by the frame until the wheel is just touching the ground, re-measure. This will indicate how far you are from full extension of the shock. A minimum of 1.5" of extension travel (at the wheel) is needed to ensure that the shock does not top out. If you are more than 3" from full extension of the shock then you are in danger of bottoming out the shock absorber.

### Adjusting Spring Height

When assembling the CoilOver, screw the spring retainer tight up to the spring (0 preload). After entire weight of car is on the wheels, jounce the suspension and roll the car forward and backward to alleviate suspension bind.

- If the car is too high w/ 0 preload then a smaller rate spring is required. Although threading the spring retainer down would lower the car, this could allow the spring to fall out of its seat when lifting the car by the frame.
- If the car is too low w/ 0 preload, then preload can then be added by threading the spring retainer up to achieve ride height. On 2.6" - 4" stroke shocks, up to 1.5" of preload is acceptable. On 5-7" stroke shocks, up to 2.5" of preload is acceptable. If more preload is needed to achieve ride height a stiffer spring rate is required. Too much preload may lead to coil bind, causing ride quality to suffer.
