4	99503014	1/2" SAE Flat Washer	12	99373003	3/8" SAE Flat Washer

Getting Started.....

1. Remove the OEM lower control arms & coil springs from the truck. If you are replacing the upper control arms and spindle, remove them too. Refer to a Factory Service Manual for the proper method.

THE SHOCK MOUNT WILL NEED TO BE INSTALLED BEFORE INSTALLING THE AIR SPRINGS. YOU NEED TO BE ABLE TO ACCESS THE INSIDE OF THE FRAME THROUGH THE COILSPRING POCKET.

2. Use Images 2 & 3 for installation of the Shock Brackets. DRIVER SIDE IS SHOWN IN THE IMAGES. The Shock Brackets locate off the bottom of the frame rail and the LARGE HOLE that is located to the rear of the coil spring pocket.

Installing Shock Bracket & Assembling CoolRide

3. Hold the DRIVER Shock Bracket on the frame rail with the LOWER TAB AGAINST THE BOTTOM OF THE FRAME AND LOCATING HOLE ALIGNED WITH THE HOLE IN THE FRAME. Using the bracket as a template, mark the holes and drill with a 3/8" drill bit. Install a 3/8" flat washer on each of (3) 3/8"-16 x 1 1/4" hex bolts. Insert the bolt/washers through the bracket and frame. Install a 3/8" flat washer and 3/8"-16 nylok nut on the threads of each of the bolts sticking through the frame. You will have to reach in the coil spring pocket to install the washers and nuts. Torque the hardware to 35 ftlbs. Repeat for the passenger side.

4. Insert the SHOCK BODY end of the shock into the shock bracket. Align the through hole with the 1/2" holes in the shock bracket. Install a 1/2" flat washer on a 1/2"-13 x 3 1/2" hex bolt. Insert the bolt/washer through the aligned holes. Install a 1/2" flat washer & 1/2"-13 nylok nut on the threads that are sticking through the bracket. Torque the bolt/nut to 75 ftlbs.

THE SHOCK BRACKETS NEED TO BE INSTALLED BEFORE THE AIRSPRINGS!

5. Apply thread sealant to the air fitting and screw it into the air spring. Assemble the upper cup bracket to the air spring, using 3/8"-16 Nylok nuts and 3/8" flat washers. Torque the 3/8" nuts 15-20 ftlbs. Thread the 8" stud into nut welded to the bottom of the cup bracket.

Installing CoolRide

6. Place the assembly up into the upper coil spring pocket; the stud will go through the factory shock hole. Fasten with a 7/16"-14 Nylok nut and 7/16" flat washer. Tighten the nut enough to hold the airspring/cup solidly in place.

Note: The airline must also be routed at this time.

7. Drill a 5/8" hole in the rear leg of the lower control arm approximately 8 1/2" from the mounting bolt. This can be moved slightly to achieve maximum tire clearance. Check tire clearance lock to lock. Attach the shock(A) to the lower control arm(B). Attach the shock(A) to the lower control arm(B). Insert the 1/2"-20 x 3" flanged head bolt(2) through the bushing sleeve. Install the aluminum T-spacer(4) on the threads of the shock bolt with the SMALL OD toward the control arm. Insert the shock bolt/shock through the holes in the control arm shock mount. Install the flat washer(5) on the threads, followed by the 1/2"-20 nylok nut(6). Torque the nut to 75 ftlbs.

8. The lower control arms & shocks need to be installed to continue with the install. Align the threaded hole of the airspring with the through hole in the lower control arm. You can move the bottom of the airspring by hand to get it in position. Install a 3/8" split lock washer & 3/8" flat washer on a 3/8"-16 x 3/4" hex bolt. Insert the bolt/washer in the hole of the control arm. Thread the bolt/washers into the bottom of the airspring. Repeat on the other side and torque the bolts 15-20 ftlbs.

Installing CoolRide

9. Make sure the air spring does not rub on anything through full suspension travel. This will damage the air spring and is not a warrantable situation. Although, it is acceptable to allow it to touch the lower control arm when fully deflated.

10. The final step is to have the vehicle realigned. You will want to have this done at ride height. Ride height is determined by air spring height. This spring should be approximately 4 3/4" tall, which should occur around 90-105 psi. This will vary to driver preference and vehicle weight.

Shock Adjustment

Shock adjustment 101- Single Adjustable

Rebound Adjustment:

How to adjust your new shocks

The rebound adjustment knob is located on the top of the shock absorber protruding from the eyelet or stud top.

You must first begin at the ZERO rebound setting, then set the shock to a street setting of 12 or handling setting of 8.

-Begin with the shocks adjusted to the ZERO rebound position (full stiff). Do this by rotating the rebound adjuster knob clockwise until it stops.

-Now turn the rebound adjuster knob counter clockwise 12 clicks. This sets the shock at 12 for a street setting. If you are after a handling setting only go 8 clicks.

Take the vehicle for a test drive.

-if you are satisfied with the ride quality, do not do anything, you are set!

-if the vehicle is too soft increase the damping effect by rotating the rebound knob clockwise 3 additional clicks.

-if the vehicle is too stiff rotate the rebound adjustment knob counter clock wise 2 clicks and you are set!

Take the vehicle for another test drive and repeat the above steps until the ride quality is satisfactory.

Note:

One end of the vehicle will likely reach the desired setting before the other end. If this happens stop adjusting the satisfied end and keep adjusting the unsatisfied end until the overall ride quality is satisfactory.

Lower Control Arm ComponentsIn the box

Item #	Part Number	Description	QTY
1	90001339	Driver Lower Control Arm (Shown)	1
1	90001340	Passenger Lower Control Arm	1
2	90000897	Lower Ball joint Assembly - Proforged # 101-10054	2
3	90000198	Rear Inner Sleeve - 3.0" Long	2
4	70010759	Delrin Bushing - with 2" Diameter Ledge	8
5	90000199	Front Inner Sleeve - 3.5" Long	2
6	90001398	Driver Bent Inner Tie Rod	1
7	90001399	Passenger Bent Inner Tie Rod	1

Getting Started.....

Congratulations on your purchase of the Ridetech C1500 StrongArms. These StrongArms have been designed to give your C1500 excellent handling along with a lifetime of enjoyment. Some of the key features of these StrongArms: Ball joint angles have been optimized for the lowered ride height, Delrin bushings are used to eliminate bushing deflection along with providing free suspension movement through the entire travel. The Delrin bushings are made from a material that is self lubricating so no grease zerks are needed.

Note: These control arms are designed for use with the Ridetech CoolRide, HQ Series Shock Kit and the MuscleBar swaybar. **The factory shocks and springs will not fit these arms.**

Installation

1. Remove the lower control arms from the truck. If you are replacing the upper control arms and spindle, remove them too. Refer to a Factory Service Manual for the proper method.

3. After removing the factory lower control arm, clean the bushing mounting surfaces on the frame. The Control Arms are marked "D" for Driver and "P" for Passenger. The Ball joint Pin points up and the steering stop is positioned to the rear of the truck. Fasten the lower arm to the frame with the OEM hardware. Torque to 120 ft-lbs.

Note: On some trucks the frame brackets may be pinched and will need to be spread back apart to allow the bushing to slide in.

Install the HQ Series Shock Kit & CoolRide Kit at this time. Refer to the instructions for each to install the kits

4. Attach the shock(A) to the lower control arm(B). Start by sliding one of the bearing spacers(1) on the shouldered shock bolt(2) with the small OD inside the bearing. Insert the 1/2"-20 x 3' flange head shock bolt through the shock bearing. Install a 2nd bearing spacer(3) on the shock bolt with the small OD inside the bearing. Install the aluminum T-spacer(4) on the threads of the shock bolt with the SMALL OD toward the control arm. Insert the shock bolt/shock through the hole in the control arm shock mount. Install the flat washer(5) on the threads, followed by the 1/2"-20 nylok nut(6). Torque the nut to 75 ftlbs.

Attaching AirSpring & Installing Spindle

5. Attach to the air spring to the lower arm using the hardware supplied with the CoolRide Kit. Torque the bolts 15-20 ft-lbs.

6. Attach the Spindle to the control arms.

Torque Specs:

Lower Ball joint - 94 ftlbs and tighten to line up cotter pin.

Install the Cotter Pin after tightening the ball joint nut.

7. Install the Inner Tie Rods. The kit includes a driver and passenger inner tie rods. The need to be installed so that they bend downward for more frame clearance. Tip: measure center to center of the OEM tie rods before disassembling and set the newly installed ones to the same dimension.

Torque Specs:

Inner Tie Rod - 46 ftlbs and tighten to line up cotter pin.

Install the Cotter Pin after tightening the tie rod.

8. Tighten all fasteners. If you are going to install the Ridetech MuscleBar, now is a good time to do it.

Suggested Alignment Specs:

Camber:	Street:	-.5 degrees
Caster:	Street:	+3.0 to + 5.0 degrees
Toe:	Street:	1/16" to 1/8" toe in

Part # 11373699 - 88-98 GM C1500 Front Upper StrongArms

Lower Control Arm ComponentsIn the box

Item #	Part Number	Description	QTY
1	90001333	Driver Upper Control Arm	1
1	90001334	Passenger Upper Control Arm	1
2	90000900	Upper Ball Joint - Proforged # 101-10053	2
3	70010759	Delrin Control Arm Bushing	8
4	90001097	Delrin Bushing Inner Sleeve	4
	99251020	1/4"-20 X 1/2" Thread Forming Screw - Not Shown	4

Getting Started.....

1. The OEM upper control arms will need to be removed from the truck. Start by disconnecting the brake line from the upper control arm. Disconnect the ABS cable from the control arm. You will need to remove one of the ball joint bolts to disconnect it.

StrongArm Installation

2. Remove the Upper Control Arms. The Camber Bolts need to be reinstalled in the same positions they are removed from. We recommend marking their positions for reassembly. Refer to the factory service manual for disassembly procedure. After removing the factory upper control arm, clean the bushing mounting surfaces on the frame.

3. If your truck has never needed the caster or camber changed, it may still have the locating slugs in the upper control arm mounts. **See Image 3.** Skip to Step 6 if your truck has already had the locating slugs removed.

4. They make a tool for removing the locating slugs or you can knock them out with an air chisel. It is best to use a blunt tool in the air chisel to knock them out. If you are having a shop align your truck, they will have the tool needed to knock the slugs out.

StrongArm Installation

5. Install the Ball Joint using the supplied 5/16" Hardware. Insert the ball joint into the arm using **Image 5** as a reference. Insert a 5/16"-18 x 1 1/4" Bolt through the ball joint and plate. The threads should pointing the same direction as the ball joint pin. Install a 5/16" Flat Washer and 5/16"-18 Nylok Nut on the threads of each bolt. Torque to 25 ftlbs.

6. Insert the control arm into the OEM location. **The Brake Line Tab is positioned to the front of the vehicle. Use the Illustration on page 2 to help aid in installing the correct control arm in the correct location.**

7. Bolt the arm to the frame using the factory camber bolts. If you marked the bolts during disassembly, reinstall them in the correct position and tighten. Torque to 140 ft-lbs.

StrongArm Installation

8. Slide the ball Joint pin into the spindle and install the castle nut on each one. Torque the ball Joint nuts and install cotter pins in each one.

Ball Joint nut Torque Specs:

Torque to 50 ft lbs and then tighten nut to align cotter pin hole not exceeding 90 ft lbs.

9. Attach the ABS cable to the control arm by removing the nut/washer from the front, inner bolt. Slide the bracket onto the bolt and replace the washer & nut. Torque the nut to 25 ftlbs.

10. Attach the brake line bracket to the new upper control arm using the supplied thread forming bolts. Align the bracket with the tab on the control arm. Attach it using the thread forming bolts supplied with the kit. These can be threaded in using a ratchet. Put downward pressure on the bolt while turning them. Torque them to 15 inlbs.

11. Tighten all fasteners.

12. Have the front end aligned.

Suggested Alignment Specs:

Camber:	Street:	-.5 degrees
Caster:	Street:	+3.0 to + 5.0 degrees
Toe:	Street:	1/16" to 1/8" toe in

Part # 11379300 - 1988-1998 C1500 Drop Spindles

Recommended Tools

1988-1998 C1500 Drop Spindles Installation Instructions

Installation

Torque Specs:

Splash Shield to Spindle:	19 ftlbs
Upper Balljoint:	74 ft lbs and then tighten nut to align cotter pin.
Lower Balljoint:	94 ft lbs and then tighten nut to align cotter pin.
Outer Tie Rod:	46 ftlbs and then tighten nut to align cotter pin.

THESE SPINDLES ARE DESIGNED FOR THE HEAVY DUTY BRAKES, 1 1/4" THICK ROTORS.

NOTE

These spindles will increase your vehicle's track width by .200" per side.

15" wheels may require trimming of OEM lower control arms.

4	99113002	M10 Flat Washer

Getting Started.....

This sway bar kit utilizes a anti-friction lining in the sway bar bushing. The lining allows the sway bar to move freely and quietly in the bushing. No lubrication is required.

1. Jack the vehicle up to a safe working height and support with jack stands. Make sure the jack stands are stable before working under the car.
2. Remove the stock sway bar.

4. Open the sway bar bushing at the split and slide it **OVER** the swasy bar. Do this for both bushings.

5. Slip the Bushing Straps over the Sway Bar Bushings.

6. Hold the Frame Plate up to the OEM holes, the Counter Sunk hole will be positioned over the front hole with the slot to the rear. Apply Red Loctite to the Flat Head Bolt. Thread a Bolt into the rear hole to help keep the plate straight. Torque the flat head bolt and remove the rear bolt.

7. Slide the SwayBar into position on the truck with the SwayBar arms above the tie rods. Install a Lock Washer & Flat Washer on the each M10 Hex Bolts. A 30mm goes in the front, with a 40mm going in the rear. Do **NOT** complete tighten the hardware at this time.

8. Install a T-Bushing on each of the 90 degree end links. The t-bushings are installed with the large diameter against the shoulder of the end link.

9. Insert the 90 degree end link/t-bushing into the swaybar end with the threads pointing toward the coilspring. Install a 2nd t-bushing with the small diameter into the swaybar. Install the nut and torque. Do this for both sides.

10. Install the End Links using **Diagram 10** as a reference. Install both end links before tightening the end link hardware. Tighten the end link nut until it is flush with the end of the bolt, and then tighten it 2 more complete rounds.

11. Center the swaybar and torque the strap hardware. Install the stop rings against the swaybar bushing. The stop rings will go against the inner side of the bushing. Take the stop rings apart and reassemble them against the bushing and tighten.

	70013280	Wavo Wave Spring	4
	70013275	R-Joint Center Ball	4
	70013276	R-Joint Composite Center Ball Cage	4

New R-Joints will be quite stiff (75-90 in/lbs breakaway torque) until they "break in" after a few miles of use. After the break in period they will move much more freely. Because the composite bearing race contains self lubricating ingredients, no additional lubrication is needed or desired. Any additional lubrication will only serve to attract more dirt and debris to the R-Joint and actually shorten its life.

Major ComponentsIn the box

R-JOINT SPACER INSTALLATION

Install the Spacers by inserting the SMALL side of the SPACER into the Center Pivot Ball. Push them in until they bottom out and stop.

LOWER FRONT R-JOINT

LOWER REAR R-JOINT

New R-Joints will be quite stiff (75-90 in/lbs breakaway torque) until they "break in" after a few miles of use. After the break in period they will move much more freely. Because the composite bearing race contains self lubricating ingredients, no additional lubrication is needed or desired. Any additional lubrication will only serve to attract more dirt and debris to the R-Joint and actually shorten its life.

Hardware ListIn the box (Kit# 99010087)

The Hardware Kit contains bags to help aid in selecting the correct hardware for the component being installed. The hardware list shows how the hardware is bagged.

Disassembly

Congratulations on your purchase of the Ridetech Rear Wishbone System. This system has been designed to give your truck excellent handling along with a lifetime of enjoyment. Some of the key features of this system: C-notches to give your suspension the travel it needs at the lowered height, 3Link setup to replace the leaf spring and provide better control of the rear axle, upper wishbone to eliminate the side-to-side movement of the differential, and the biggest feature of all, it allows the use of ShockWaves or CoilOvers.

Note: This system is designed for use with the Ridetech ShockWaves or CoilOvers. **The factory shocks and springs or the factory sway bar will not fit this 4Link.**

Disassembly

1. Raise the vehicle to a safe and comfortable working height and support it by the frame. You will need to be able to move the rear differential up and down. Use a jack under the rear axle so it can be raised and lowered as needed during the install.
2. **Remove the bed, retaining the hardware for reassembly. This kit can NOT be installed with the bed on. The bed requires minor modifications before reinstalling.**
3. Remove the leaf springs and shock absorbers. Refer to the factory service manual for proper disassembly procedures.

Getting Started.....

4. The brake line/wire clamp will need to be removed from the inside of the driver side frame rail. This will allow you to move it out of the way when cutting the frame for the c-notch.

5. Unbolt the brake line bracket from the inside of the driver side frame rail.

"C" Notch Installation

6. To allow maximum drop on this truck, the frame must be notched. The template for the notch will locate off of the 2 existing holes. **Image 6** illustrates the holes used. Use the supplied "C" Notch template to mark out the frame for cutting. Before cutting out the frame, support the frame in front of and behind the "C" Notch area. We suggest doing one side at a time.

7. Use the supplied Template to mark the cut lines on the frame. Center Punch the "⊕" in the corners of the cut area.

NOTE: IF YOU WOULD HAPPEN TO NEED A NEW TEMPLATE, IT CAN BE FOUND ON OUR WEBSITE. GO TO www.ridetech.com, ENTER THE KIT NUMBER IN THE SEARCH BAR. THE TEMPLATE CAN THEN BE DOWNLOADED OR PRINTED.

8. Drill out the two corners with a 1/2" drill bit. This will give the cut a round edge and eliminate the possibility for stress fractures. Then cut the notch with a saw-z-all, cutoff wheel, or plasma cutter. Grind all edges smooth. Check the inside of the frame for wires or lines before drilling or cutting.

"C" Notch Installation

9. Slip the C-Notch over the frame rail. Use the C-Notch as a template to drill the (9) holes in the side of the frame. Use a 7/16" drill bit to drill the holes. The side holes use 7/16"-14 x 1 1/4" bolts except for the circled hole in **Image 9**, it uses 7/16"-14 x 1 1/2". The passenger side uses all 7/16"-14 x 1 1/4". Install a 7/16" Flat Washer on each of (9) 7/16"-14 Bolts. Insert a bolt/washer in each hole. Install a 7/16" Flat Washer and 7/16"-14 Nylok Nut on the threads of each bolt/washer and tighten. Torque the hardware to 50 ftlbs.

IT IS IMPORTANT TO TIGHTEN THE SIDE HARDWARE BEFORE DRILLING THE TOP AND BOTTOM HOLES.

10. Bolt the Bumpstop into the C-notch using the hardware included on the bumpstop.

REPEAT STEPS 6-10 for the 2nd C-Notch.

STEPS 11-13 ARE DRIVER SIDE ONLY!

11. Drill out the small rear locating hole to 5/16". Also, remove the nut from the 7/16" Bolt above the small hole. Insert a 5/16"-18 x 1 1/4" BUTTUN HEAD into the drilled hole.

"C" Notch Installation

12. Slip the Brake Line Bracket over the 7/16" and 5/16" Bolts sticking through the back side of the frame. Install a Flat Washer & Nut on each and tighten.

13. Install a 5/16" Flat Washer on each of (2) 5/16" x 1 1/4" Bolts. Install the bolts/washers in the Brake Line Bracket and slip the OEM brake line bracket over the (2) bolts. Install a 5/16" Flat washer & 5/16" Nylok Nut on each bolt and tighten.

14. Use a 7/16" Drill bit to drill the remaining holes in the top and bottom of the frame. Install a 7/16" Flat Washer on the remaining 7/16" x 1 1/4" Bolts. Insert bolt/washers in the drilled holes of the c-notch. Install a 7/16" Flat washer and 7/16" Nylok Nut on the threads sticking through the c-notch/frame. Torque the hardware to 50 ftlbs.

Lower Axle Mount Installation

15. Insert the upper wishbone crossmember between the c-notches. The bung in the center of the cross member is tapered, the large side of the taper will need to be down. The gusset in the center will also be bent downward. Insert the cross member in position, lining up the 4 holes in the side flanges with the 4 bolt holes in each c-notch. Install a 7/16" flat washer on each of (8) 7/16"-14 x 1 1/2" bolts. Line up bolt holes and insert a bolt/washer in each one. Install a 7/16" flat washer on the threads of the bolts that is sticking through the flanges. Torque to 50 ftlbs.

16. The Axle Mounts are the same for driver and passenger sides. Install a supplied 5/8" U-bolt on each side of the OEM leaf spring pad. Slide an Axle Mount on the U-bolts with the top tabs inserted into the leaf spring pad. Hold the mount in place and install a 5/8" Flat Washer and 5/8" High Nut on the threads of the u-bolts sticking through the axle mount. Tighten the nuts evenly in a criss-cross fashion making sure the tabs of the axle mount are touching the leaf spring pad evenly. Torque the nuts in a criss-cross fashion to 60 ftlbs. Repeat on the other side.

17. The Lower Shock Mount attaches with (1) 1/2"-13 x 1 1/4" Hex Bolt, (1) 1/3"-13 x 1 3/4" Hex Bolt, & (2) 1/2" Flat Washer, & (2) 1/2"-13 Nylok Nuts. The Lower Mount gets attached to the 2nd and 3rd hole up from the bottom of the Axle Mount. When the Shock Mount is installed correctly, the bottom of the Lower Shock Mount is 1/8" above the bottom of the Axle Mount. Insert the Bolts through the Aluminum Shock Mount with the 1 1/4" long bolt in the top hole, 1 3/4" in the bottom hole. Insert the bolts through the Axle Mount and install the Flat Washers & Nylok Nuts on the Threads sticking through. Repeat on both sides and torque the Bolts/Nuts to 75 ftlbs. Install a 5/8" Flat Washer onto the 5/8"-18 threads of the shock stud. Apply Red Loctite to the 5/8" threads of the stud. Thread the Shock Stud into the threaded hole of the Lower Mount. Repeat on both sides and torque the Shock Stud to 65-75 ftlbs.

Installing Lower Bars

18.

18. Insert (2) Narrow R-Joint Spacers into each side of the R-Joint with the small OD inserting into the R-Joint.

19.

19. Insert the Rear Lower Bar R-Joint into the Lower Axle Bracket. Line up the through hole of the R-Joint with the of holes of the Axle Bracket.

20.

20. Install a 5/8" Flat Washer on to a 5/8"-18 x 3" Hex Bolt, insert into the lined up holes. Install a 5/8" Flat Washer followed by a 5/8"-18 Thin Jam Nylok Nut. Repeat on both sides and tighten the Bolts/Nuts enough to eliminate any gaps.

Installing Lower Bars & Wishbone Assembly

21. Insert the long R-Joint Spacers into the front of the lower bar with the small OD inserted into the R-joint. Insert the Front Lower Bar R-Joint into the Front Leaf Spring Mount. Line the through hole of the R-Joint with the holes of the leaf spring mount. Install a 9/16" Flat Washer on to a 9/16"-18 x 5" Hex Bolt, insert into the lined up holes. Install a 9/16" Flat Washer followed by a 9/16"-18 Thin Jam Nylok Nut. Repeat on both sides and tighten the Bolts/Nuts enough to eliminate any gaps.

22. Insert the rear of the Wishbone into the Axle Bracket lining up the holes. The ball joint pin needs to be pointing UP. Use **Images 22 & 23** to assist you with positioning of the ball joint pin. Install a 1/2" Flat Washer on each of (2) 1/2"-13 x 3 1/4" Bolts. Insert them into each Bracket/Bushing hole from the outside with the threads pointing to the center. Install a 1/2" Flat Washer and 1/2"-13 Nylok Nut on the threads of each bolt and tighten to 50 ftlbs.

23. **Image 23** illustrates a correctly installed upper wishbone.

Wishbone Axle Mount Installation

24. Remove the bolt that attaches the brake line junction block to the bracket. The junction block will be reattached later.

25. Remove the top (7) bolts of the differential cover leaving in the bottom (3).

IF THE DIFFERENTIAL COVER HAS A GASKET BETWEEN IT AND THE HOUSING, IT WILL NEED TO BE REMOVED AND SEALED WITH RTV SEALANT. Be sure to refill the differential with the correct gear oil before driving.

26. The 7 OEM bolts that were removed from the top of the differential cover will be replaced with 5/16"-18 x 2 1/4" Studs. These Studs and the nuts used to install them are supplied in the Hardware Bag labeled "Upper Wishbone Differential Mount". Thread the (2) 5/16"-18 Hex Nuts on one of the studs. Using (2) wrenches, tighten the nuts against each other locking them together. Apply Red Loctite to the other end of the stud.

Wishbone Axle Mount Installation

27. Thread the Stud into one of the 7 threaded holes in the axle housing. Torque the Stud to 25 ftlbs. Use 2 wrenches to unlock the nuts from each other and remove them from the stud. Repeat the process on the remaining 6 studs.

28. Position the Axle Bracket/Wishbone in place with the wishbone to the front of the truck. Line up the (7) holes in the axle bracket with the (7) threaded studs of the Differential.

29. Using the Hardware Bag "Upper Wishbone Differential Mount", install a 5/16" Flat Washer & 5/16"-18 Nylok Nut on each of (7) 5/16" Studs. Torque to 25 ftlbs

Wishbone Installation

30. Using the Hardware Bag "Brake Line Junction Block", install a 5/16" Flat Washer on a 5/16"-18 x 1 1/2" Bolts. Insert the bolt/washer through the junction block and mounting hole in the differential bracket. Install a 5/16" Flat Washer & 5/16"-18 Nylok Nut on the threads of the bolt. The brake lines will need to be tweaked to get the distribution block in position. Torque the bolts to 25 ftlbs.

31. Install the Rubber Boot on the Ball Joint. **If the rubber boot has a plastic protector on it, discard the plastic protector.** Insert the ball joint pin into the opening of the upper bridge. Push it up in the hole and install the castle nut supplied in the kit.

32. Torque the ball joint nut to 50 ftlbs. Verify if the hole in the ball joint pin aligns with any of the slots of the castle nut. Tighten the castle nut to align them. **DO NOT LOOSEN THE CASTLE NUT.** Install the supplied cotter pin. Thread the grease zerk into the ball joint and grease it.

Shockwave/Coilover Mounting

33. Insert the 1/2" ID Shock Bearing Spacer into each side of the ShockWave/CoilOver Bearing. Install a 1/2" Flat Washer on a 1/2"-13 x 2 3/4" Bolt. If installing ShockWaves, insert the top of the shock into the shock mount on the c-notch with the adjusting knob to the outside. If installing CoilOver, insert the bottom of the shock into the shock mount on the c-notch. Line up the holes and insert the bolt/washer. Install a 1/2" Flat Washer and 1/2"-13 Nylok Nut on the threads and tighten to 50 ftlbs.

34. The Shock Stud requires spacers that are .400" long (90002067). Install a 5/8" ID 90002067 spacer (**Small side towards shock body**) onto the lower Shock Stud. Slide the bottom of the Shock onto the Stud. Install a second 5/8" ID 90002067 Spacer onto the Stud (**small side towards shock**). You may need to jack the rearend up to Slide the Shock onto the Stud.

35. Install the 7/16" Flat washer and 7/16" Nylok nut. Tighten the upper and lower shock bolts. Torque the Upper Bolt to 50 ftlbs and the Lower Nut to 40 ftlbs. The designed ride height of the CoilOver/Shockwave is 14 1/2" center to center.

Carrier Bearing, Emergency Brake Cable Relocation

**TRUCKS WITH CARRIER BEARINGS ONLY!
IF YOUR TRUCK DOESN'T HAVE A CARRIER
BEARING, SKIP TO STEP 38**

36. The driveshaft carrier bearing will need to be relocated to optimize driveline angles at your new lower ride height. Unbolt the carrier bearing.

37. Install carrier bearing spacer between carrier bearing housing and cross member. Secure with 3/8" x 2 1/2" bolts, 3/8" flat washers, & 3/8" nylok nuts.

38. On some years, the emergency brake cable mounting will need to be modified for clearance. If your cable mount on the snout of the differential looks like **Image 38**, no changes will be needed. If it looks like **Image 39**, the mount will need to be flipped around.

Emergency Brake Cable Relocation, Bed Modification

39. If your emergency brake cable mount looks like **Image 39**, the mount will need to be flipped around. Start by removing the nut from the attaching bolt. Next, remove the bolt to detach the mount from the snout of the differential.

40. Use a flat bladed screwdriver to remove the mount from the emergency brake cable. Flip it around so that the bolt hole is to the rear of the truck. Use a pair of pliers to snap the mount back onto the cable.

41. Slip the mount back in position on the snout of the differential. Reattach it with the OEM hardware that was removed previously. Push the cable down as far as it will go before tightening the hardware. With it in position, tighten the hardware.

Bed Modification

42. Trimming of the bed brace that is in between the wheel wells is necessary to clear the c-notches and wishbone. We cut ours with a diegrinder and cut off wheel. **Image 42** illustrates the bed brace cut out. The cut starts 3 1/2" from the end of the brace and runs all the way across leaving 3 1/2" on the other end. It needs to be cut even with the flange that attaches the brace to the bed floor.

43. Your bed brace should look like **Image 43** after cutting.

44. If you haven't already, install the bump stops into the c-notch above the axle using the 3/8" flat washer and 3/8"-16 nylok nut supplied. A bumpstop will need to be installed in each c-notch.

45. Reinstall the bed.

46. Set ride height on the truck. The ride height of the Shockwave/CoilOver is approximately 14 1/2". If you are using ShockWaves, this is done by changing the air pressure in the ShockWaves. If you are using CoilOvers, the ride height is done by using the adjuster nut for the coil spring. The coil spring on the CoilOver will have some preload in the spring to get ride height, this is normal.

WARNING: ATTEMPTING TO REMOVE THE AIR FITTING WILL DAMAGE IT AND VOID THE WARRANTY.

SHOCKWAVE CARE GUIDE

PLEASE READ

The air spring locking ring **IS NOT** adjustable. This ring is set to a specific position at the factory to optimize the air spring stroke with the shock stroke. Attempting to adjust this ring will void your warranty.

DO NOT attempt to remove the press-in air fitting. It may result in damage to the composite cap and void your warranty.

DO NOT drive the vehicle with the air springs fully deflated. Severe damage to the internal bumpstop, shock bushings, and shock mounts may occur.

- Avoid driving the vehicle with the air springs overinflated or “topped out”. Over time the shock valving may suffer severe damage or total failure. Our recommended ride-height range is between 40-60% of total suspension travel.
- Do not allow the air spring bellows to rub on or interfere with any surrounding objects. Ensure the ShockWaves are adequately distanced from the exhaust system. Damage or total failure may occur.
- Do not use harsh or abrasive chemicals or solvents to clean your ShockWaves. A mild soap and water solution is sufficient.
- When working around or near your shocks, avoid allowing overspray of harsh chemicals or solvents to make contact with your ShockWaves.
- When attempting to clock the air fitting, you may rotate the air spring assembly on the shock. Ensure the fitting does not contact the vehicle frame or other surrounding objects.

TUNING GUIDE

SINGLE-ADJUSTABLE SHOCKS

The Basics...

COMPRESSION

This typically occurs when you hit a bump in the road. The bump forces the wheel/tire/suspension assembly to "compress" or move upwards into the car.

REBOUND

Rebound is the opposite of compression. This occurs when the wheel/tire/suspension assembly falls into a pothole, or simply "rebounds" from being compressed.

Where Are The Knobs?

HQ Series Shocks

- The adjustment knob is located on the top of the shock, either protruding from the side of the eyelet, or atop the stud.
- This knob provides rebound adjustment only.

Knob Function

Counterclockwise

=
Softer

Clockwise

=
Firmer

TUNING GUIDE

SINGLE-ADJUSTABLE SHOCKS

Initial Rebound Setting

NOTE: Before jumping straight to a middle-of-the-road shock setting, we recommend you experience the full range of adjustment potential of your new shocks by first driving your vehicle at both the “full stiff” and “full soft” settings. Understanding how your shocks behave at these extremes will provide recognizable reference points as you attempt to dial in your settings.

1. Begin by setting your shocks to the “full stiff”, or minimal rebound position. You do this by turning the adjustment knob clockwise until it stops.

2. Now turn the adjustment knob counterclockwise 12 clicks. This is the approximate center of the adjustment range.

3. Take the vehicle for a test drive. Try to determine if you are experiencing any of the unwanted behaviors found at the extremes of the adjustment range. If you are satisfied with the ride quality and handling, you’re all set. Enjoy the ride!

4. If the vehicle feels too “floaty” or soft, turn the knob a few clicks clockwise to increase the damping effect.

If the ride quality is still too harsh or stiff, turn the knob a few more clicks counterclockwise to decrease the damping effect.

5. Take the vehicle for another test drive. If necessary, repeat the steps above until your desired optimal ride quality has been achieved.

General Guidelines

- The rear shocks typically have the the most influence on ride quality. This is due to your seating position being closer to the rear than the front.
- Adjustments to the front shocks will generally require 3-4 clicks in any direction to be noticeable, while adjustments to the rear shocks may only require 1-2 clicks to be felt.
- Don't be afraid to turn the knobs and experience the full adjustment range. You are not going to hurt anything and you can always go back if you adjust too far one way or the other.
