Shock Dimensions

Measured From Center-To-Center Of Shock Sleeves

Compressed	10.15"
Ride Height	13.00"
Extended	14.90"

EXPLODED VIEW AND PARTS LISTING

Item #	Part #	Description	Qty
1	20449999	4.75" Stroke Shock - Steel Body	1
2	70011138	3/4" ID Shock Bushing	2
3	90002103	.625 ID Shock Sleeve	1
4	70011195	.437" ID Shock Sleeve	1

Shock Installation

1. Attach the shock body and eyelet to the OEM frame mounts. Use the OEM hardware to attach the shock (Figure 1).

NOTE: If necessary, the shock may be mounted inverted to position the adjuster knob for easier access (Figure 2).

TUNING GUIDE

SINGLE-ADJUSTABLE SHOCKS

The Basics...

COMPRESSION

This typically occurs when you hit a bump in the road. The bump forces the wheel/tire/suspension assembly to "compress" or move upwards into the car.

REBOUND

Rebound is the opposite of compression. This occurs when the wheel/tire/suspension assembly falls into a pothole, or simply "rebounds" from being compressed.

Where Are The Knobs?

RQ-S Series Shocks

- The adjustment knob is located on the top of the shock, either protruding from the side of the eyelet, or atop the stud.
- This knob provides rebound adjustment only.

Knob Function

Counterclockwise

=
Softer

Clockwise

=
Firmer

TUNING GUIDE

SINGLE-ADJUSTABLE SHOCKS

Initial Rebound Setting

NOTE: Before jumping straight to a middle-of-the-road shock setting, we recommend you experience the full range of adjustment potential of your new shocks by first driving your vehicle at both the “full stiff” and “full soft” settings. Understanding how your shocks behave at these extremes will provide recognizable reference points as you attempt to dial in your settings.

1. Begin by setting your shocks to the “full stiff”, or minimal rebound position. You do this by turning the adjustment knob clockwise until it stops.

2. Now turn the adjustment knob counterclockwise 12 clicks. This is the approximate center of the adjustment range.

3. Take the vehicle for a test drive. Try to determine if you are experiencing any of the unwanted behaviors found at the extremes of the adjustment range. If you are satisfied with the ride quality and handling, you’re all set. Enjoy the ride!

4. If the vehicle feels too “floaty” or soft, turn the knob a few clicks clockwise to increase the damping effect.

If the ride quality is still too harsh or stiff, turn the knob a few more clicks counterclockwise to decrease the damping effect.

5. Take the vehicle for another test drive. If necessary, repeat the steps above until your desired optimal ride quality has been achieved.

General Guidelines

- The rear shocks typically have the most influence on ride quality. This is due to your seating position being closer to the rear than the front.
- Adjustments to the front shocks will generally require 3-4 clicks in any direction to be noticeable, while adjustments to the rear shocks may only require 1-2 clicks to be felt.
- Don’t be afraid to turn the knobs and experience the full adjustment range. You are not going to hurt anything and you can always go back if you adjust too far one way or the other.
